Subject: Application for Security Engineer, Insider Threat (R023888)

Dear Hiring Team,

I am excited to apply for the **Security Engineer, Insider Threat** position at GoDaddy.

I currently work as a Security Analyst, where I investigate security incidents involving phishing infrastructure, typosquatted domains, malicious websites, and indicators of compromise. In addition, I completed a Security Analyst internship focused on SOC operations, alert triage, and incident investigation using Splunk SIEM.

To further strengthen my practical skills, I built a SOC Detection Engineering Lab using Splunk Enterprise, Sysmon, Windows, and Ubuntu Linux. Through this project, I developed and tested detections for PowerShell execution, registry modifications, DNS queries, network connections, and Linux SSH activity while gaining hands-on experience in log analysis and structured security investigations.

Although my professional experience has primarily been in threat intelligence and security monitoring rather than insider threat investigations, I am eager to apply my analytical mindset, SIEM knowledge, and investigation experience to this domain. I enjoy correlating evidence across multiple data sources, documenting findings, and continuously expanding my technical skills.

I am particularly excited about GoDaddy's emphasis on collaboration, continuous learning, and building effective security detections. I would welcome the opportunity to contribute to your Security Engineering team while continuing to grow as a cybersecurity professional.

Thank you for considering my application. I look forward to the opportunity to discuss how my skills and enthusiasm align with this role.

Sincerely,

Monisha M R
